

Physical Architecture Design:

On the next page, the physical architecture design is diagrammed. As it can be seen, the LOLA system interacts with different servers by the LAN (Local Area Network). The local area network connects the client workstation (LOLA System) to each server, including the database/domain hosting site (Domain.com), payment processor (Stripe), content management system (WordPress), and Google. The LAN allows each one of the nodes (workstation, server, database, etc.) to communicate with one another.

The Tomahawk Group for LOLA project
