

Assignment #4

Name: Jenet Baribeau
Course: CECS 220-01-4168
Date: 11/2/2016

1. PP 8.1

While the number isn't 51, enter in user data. Create an array with a limit of 50. Scan the input.

```
readInts.java
Assignment_4 ▸ src ▸ (default package) ▸ readInts ▸ main(String[]): void
1 import java.util.Scanner;
2
3 public class readInts {
4
5     public static void main(String[] args) {
6         // TODO Auto-generated method stub
7         final int LIMIT = 50;
8         int input = 0;
9         int[] integers = new int[LIMIT];
10        Scanner scan = new Scanner (System.in);
11
12        while(input != 51)
13        {
14            System.out.print("Enter an arbitrary number of integers in the range 0-50 (enter 51 to exit) : ");
15            input = scan.nextInt();
16            if(input == 51) break;
17            if(input < 0 || input > 50){
18                System.out.println("Number out of range.");
19            }
20        }
```

Continue until there is an integer enter over 51. Once entered for every integer less than 50, count and print them out.

```
        }
        integers[input]++;
        continue;
    }

    System.out.println("\nCounts of the integers"
        + " entered: ");
    for (int i=0; i<=50; i++)
        if (integers[i]>0)
            System.out.println(i + "\t" + integers[i]);
    }
```

Output. I know I have an error but didn't use a try catch.

```
Console [Java Application] C:\Program Files\Java\jre1.8.0_111\bin\javaw.exe (Nov 2, 2016, 7:54:09 PM)

13    }
14 }
15
16
17
18
```

Finished Product:

3. PP9.2

I had a few issues with figuring out the %s and printf . There were several "Main" errors until I found the right combination.

Abstract Hospital Employee

```
1 package hospital;
2
3 public class HospitalEmployee {
4
5     protected String job;
6     protected String hospital;
7
8     public HospitalEmployee(String job, String hospital)
9     {
10         this.job = job;
11         this.hospital = hospital;
12     }
13
14     public void PerformJob(){
15     }
16
17 }
18
19 }
20
```

There are 6 extensions of the employee. This first one made the remainder very easy.

Administrator

```
package hospital;

public class Administrator extends HospitalEmployee
{
    private final static String jobTitle = "Administrator";

    //Constructor to pass hospital of employee
    //requires super
    public Administrator(String hospital)
    {
        super(jobTitle, hospital);
    }

    //print the message
    public void PaperWork()
    {
        String message = String.format(
            "A %s does paperwork at %s.", job, hospital);
        System.out.println(message);
    }

    @Override
    public void PerformJob()
    {
        PaperWork();
    }
}
```

Hospital Driver

```
package hospital;

public class HospitalEmployees {

    public static void main(String[] args) {
        // TODO Auto-generated method stub
        System.out.println("Creating an Administrator...");
        Administrator admin = new Administrator("Aurora BayCenter Hospital");
        System.out.println("Creating a Doctor...");
        Doctor doctor = new Doctor("University Hospital");
        System.out.println("Creating a Janitor employee...");
        Janitor janitor = new Janitor("St. Jude Hospital");
        System.out.println("Creating a Nurse employee...");
        Nurse nurse = new Nurse("Georgetown Hospital");
        System.out.println("Creating a Receptionist employee...");
        Receptionist receptionist = new Receptionist("Hamptons Heritage");
        System.out.println("Creating a Surgeon employee...");
        Surgeon surgeon = new Surgeon("Baptist East Hospital");
        System.out.println();
        System.out.printf("Performing Job...");
        admin.PerformJob();
        System.out.printf("Performing Job...");
        doctor.PerformJob();
        System.out.printf("Performing Job...");
        janitor.PerformJob();
        System.out.printf("Performing Job...");
        nurse.PerformJob();
        System.out.printf("Performing Job...");
        receptionist.PerformJob();
        System.out.printf("Performing Job...");
        surgeon.PerformJob();

        System.out.println();
        System.out.println("The End.");
    }
}
```

Doctor

```
1 package hospital;
2
3 public class Doctor extends HospitalEmployee {
4
5     //static job title
6     private final static String jobTitle = "Doctor";
7
8     //constructor inherits employee
9     public Doctor(String hospital)
10    {
11        super(jobTitle, hospital);
12    }
13
14    //Doctor's diagnose - print message
15    public void Diagnose()
16    {
17        String message = String.format("A %s diagnoses patients at %s.", job, hospital);
18        System.out.println(message);
19    }
20
21 }
22
23 @Override
24 public void PerformJob()
25 {
26     Diagnose();
27 }
28 }
29 }
```

Surgeon

```
1 package hospital;
2
3 public class Surgeon extends HospitalEmployee {
4
5     // Static Job Title
6     private final static String jobTitle = "Surgeon";
7
8     // Constructor requires hospital of employee
9     // passes to super constructor
10    public Surgeon(String hospital) {
11        super(jobTitle, hospital);
12    }
13
14    //prints surgery message
15    public void Surgery() {
16        String message = String.format(
17            "A %s performs surgery at %s.", job, hospital);
18        System.out.println(message);
19    }
20
21 @Override
22 public void PerformJob() {
23     Surgery();
24 }
25 }
```

Nurse

```
1 package hospital;
2
3 public class Nurse extends HospitalEmployee {
4
5     // Static Job Title
6     private final static String jobTitle = "Nurse";
7
8     // Constructor requires hospital of employee
9     // passes to super constructor
10    public Nurse(String hospital) {
11        super(jobTitle, hospital);
12    }
13
14    //prints take blood message
15    public void TakeBlood() {
16        String message = String.format(
17            "A %s takes blood at %s.", job, hospital);
18        System.out.println(message);
19    }
20
21 @Override
22 public void PerformJob() {
23     TakeBlood();
24 }
25 }
26 }
```

Receptionist

```
1 package hospital;
2
3 public class Receptionist extends HospitalEmployee {
4
5     // Static Job Title
6     private final static String jobTitle = "Receptionist";
7
8     // Constructor requires hospital of employee
9     // passes to super constructor
10    public Receptionist(String hospital) {
11        super(jobTitle, hospital);
12    }
13
14    //prints answer phone message
15    public void AnswerPhones() {
16        String message = String.format(
17            "A %s answers phones at %s.", job, hospital);
18        System.out.println(message);
19    }
20
21 @Override
22 public void PerformJob() {
23     AnswerPhones();
24 }
25 }
```

Janitor

```
1 package hospital;
2
3 public class Janitor extends HospitalEmployee {
4
5     // Static Job Title
6     private final static String jobTitle = "Janitor";
7
8     // Constructor requires hospital of employee
9     // passes to super constructor
10    public Janitor(String hospital) {
11        super(jobTitle, hospital);
12    }
13
14    //prints clean message
15    public void Clean() {
16        String message = String.format(
17            "A %s cleans at %s.", job, hospital);
18        System.out.println(message);
19    }
20
21 @Override
22 public void PerformJob() {
23     Clean();
24 }
25 }
```

4. PP9.1

The car moving was more challenging and far more complicated to make it move.

```
1 import java.awt.*;
2 import java.util.*;
3 import java.applet.*;
4
5
6
7 public class movingCar extends Applet implements Runnable
8 {
9     Thread t;
10    //4 variables used to vary the car's positions.
11    int x1=0,x2=380,y1=50,y2=250;
12    public void start()
13    {
14        if(t==null)
15        {
16            t=new Thread(this,"New Thread");//New side Thread created on start of applet.
17            t.start();
18        }
19    }
20    public void stop()
21    {
22        if(t!=null)
23        {
24            t=null;//On stop of applet the created thread is destroyed.
25        }
26    }
27    //Implementation of method run() of Runnable interface.
28    public void run()
29    {
30        Thread t1=Thread.currentThread();
31        while(t==t1)
```
